Fishy Facts

A fish is an animal, which lives and breathes in the water. All fish are vertebrates, which mean they have a backbone.

A Shark's skeleton is made up of Cartilage. **A person who studies fish** is called an **Ichthyologist**.

Fish make up about half of all known **vertebrate species**.

The **Dwarf Shark** is as small as your hand, while the **Whale Shark** can be as large as a bus.

Some fish have lungs and breather air, but must breathe through gills.

Fish are slimy because of a type of mucus on their skin. This **slimy** mucus is important because it protects them against disease and parasites and covers any wounds to prevent infection.

Some species release toxins in their slim, which ward off attacking creatures while other species use it to feed their young.
